What's included

- PNG exports for 3D illustrations
- Lottie animations for success, pending, error, and loading states, and the app splash screen

Folder structure

Each folder maps to a feature or flow as named. Shared assets (used across multiple pages) are in their own folder, check there first if you're looking for something that isn't in a page-specific folder.

Sticky / responsive behaviour

Some pages have sticky content on desktop that becomes a fixed bottom bar on mobile. Check the prototype in Figma or the desktop page behaviour in Figma Mirror for the intended interaction.

- HDP: the booking component is sticky on desktop, but appears as buttons at the bottom on mobile.
- Locality/Landmark/City pages: the contact component is sticky on desktop, but appears as a button on mobile.
- Pages present in both the app and website have slightly different behaviour, e.g. the app uses smaller headlines since SEO doesn't apply.
- The homepage differs between the app and the website, these are not the same layout.

Notes

- Pagloo appears in Error states, Empty states, and as a "bouncer" in the Community Event success state.
- Homepage reviews (website) are static, sourced from tenants by the community team and should be kept as-is.
- HDP reviews are dynamic and property-specific.
- All heading copy should be used as-is from Figma.
- FAQ copy is not yet available in Figma, placeholder/TBD.
- About section content and ratings will be dynamic.
- "Straight from the Feed" on the homepage links directly to Instagram and shows our latest reels.
